# kognitive NETWORKS

ITASCA, IL – **K4 Mobility**, a network management platform provider in the maritime market, is proud to announce its **rebranding as Kognitive Networks**, as part of a strategic expansion into new markets.

**Kognitive Networks** is revolutionizing network management by bringing Software-Defined Wide Area Networking (SDWAN) and Secure Access Service Edge (SASE) technologies to a broad array of industries and use cases. Targeting enterprises that have many locations and require seamless communication, Kognitive Networks provides a software-first, wireless-aware approach to optimizing connectivity across multiple networks, including LEO/GEO satellites and multi-carrier 4G/5G cellular networks. The integrated security features, connectivity controls, and unified system management enables enterprises to take advantage of the evolving wireless landscape to rapidly scale their business and network operations while reducing operating and technology expenses.

"We've proven our solution in the highly challenging maritime market with over 1,100 contracted vessels, and due to this, we are now beginning to serve customers in other industries that see similar benefits. Our first non-maritime fixed-location customer uses 5G from different network operators and Starlink wireless internet, with Kognitive's Network Management Software offering a single pane of glass visibility, control, and security across all locations, devices, and networks" explained Anand Chari, CEO of Kognitive Networks. "We are also expanding globally with customers in Asia, Europe, and the Middle East. Our suite of management tools helps customers scale their networks efficiently, while maintaining the access controls required for secure operations."

This strategic expansion underlines the company's determination to lead in an era where new network technology will transform and empower enterprises like never before.
